

COMPETITIVE LANDSCAPE ANALYSIS

CONFIDENTIAL – ATTORNEY WORK PRODUCT – NOT FOR PUBLIC DISCLOSURE

STRATEGIC ANALYSIS - NOT CLAIM LIMITATIONS *References to specific algorithms (e.g., "SHA-256") or technical details are provided as concrete examples to illustrate distinctions from prior art. Patent claims use generic terminology to maintain maximum scope.*

DATE: January 3, 2026 | **RE:** COMPETITIVE LANDSCAPE ANALYSIS

I. Systems That Claim “Logging” — Not Structural Gating Logging occurs after the AI acts. OneDuo™ prevents execution before it happens; the database persistence layer physically refuses the state transition via trigger-enforced logic.

II. Systems Focused on “Content Forensics” These systems track content rather than governing AI behavior. They do not bind human approval to execution events or maintain a relational dependency between reasoning logs and approval ledgers.

III. Systems That “Recommend” Oversight (UI-Level) UI-layer rules can be bypassed via APIs. OneDuo™ moves governance to the database architecture. If the ledger is not approved, the machine-level constraint prevents the transition.

IV. Blockchain / Token-Gate Governance Systems These govern who can use a system. OneDuo™ governs when an AI may execute a specific state transition based on reasoning-to-intent mapping.

V. “Delete With Proof” Systems Existing systems issue deletion receipts but lack control authority over AI state changes. OneDuo™ binds cryptographic destruction certificates directly into a governed execution lifecycle.

CORE SUMMARY: No prior art implements a database-layer Boolean constraint that blocks AI artifact finalization unless every active reasoning entry has a cryptographically timestamped, immutable human approval record. That structural enforcement is the moat.
